BUILDCHAT — José Fernando Kuri Lois

Transcript source and limits

This is a truthful session record prepared from the visible assignment request, version-control history, test outputs, deployment responses, and browser checks in this workspace. The VS Code debug-log file contains only a `session_start` event. The local session index contains four rows for this chat: the original user request, two terminal-notification messages, and the final assistant response; intermediate assistant turns and tool exchanges are absent. Therefore the indexed content is not a complete transcript. This PDF is **not** represented as verbatim and does not invent missing messages or screenshots. It records a verbatim request excerpt and verified actions/results.

User request (verbatim excerpt)

> “I have approximately 60 minutes to complete my Building with AI assignment. Work autonomously, efficiently, and prioritize a fully functioning deployed application.”
>
> “PACKET BEFORE CODE — MANDATORY”
>
> “Do not fabricate deployment URLs, commits, tests, images, or evidence.”

Verified development record

- Inspected the existing `cuaderno` GitHub workspace, its `docs/` Next.js app, existing Vercel links, worktree changes, and Blueprint/source documents. Kept existing Week 5/Week 6 work outside the First-Proof commits.
- Authored the First-Proof packet and original vector UI mockup before changing app code. The mockup is explicitly described as an illustrative SVG, not generated-image or product screenshot evidence.
- Added a typed deterministic calculator with fictional defaults (12 candidates, 3 employers, 10 minutes, $180 MXN/hour, $500 MXN budget, and $250 MXN willingness per employer) and six Node/TypeScript tests.
- Built the responsive English First-Proof dashboard with validation, cost and budget/willingness indicators, three planning scenarios, explicitly simulated AI explanation, and human/candidate safeguards.
- Mechanical checks: `npm test` passed 6/6; `npm run typecheck` passed; `npm run build` passed and generated `/`, `/week5`, and `/week6`.
- Deployed V1 to the existing Vercel `cuaderno` project. Public alias: `https://cuaderno-taupe.vercel.app`; an unauthenticated HTTP smoke check returned HTTP 200.
- Walked the public interface with a clearly labeled simulated small-business-owner persona; no real participant or user interview is claimed. At 320 px, no horizontal overflow was observed. Changing the budget to $300 showed “OVER PILOT BUDGET” and “Over budget by $60 MXN.”
- Found a reproducible production form bug: the calculator accepted a $500.50 budget but the HTML number input reported `stepMismatch` due to integer-only `step=1`. Fixed money precision and added a regression test; fractional review minutes are also allowed consistently with validation.
- Rechecked V2 on the public alias: $500.50 and 7.5 minutes both report `stepMismatch === false`, the estimate recalculates, and the final public app remained responsive.
- Ran `npm audit fix` after a dependency audit identified advisories; the app updated to Next.js 16.4.0. Tests, typecheck, production build, and production dependency audit then passed with 0 vulnerabilities. Published a final security-patched production deployment at the same alias.
- Pushed seven scoped First-Proof commits to the existing GitHub repository. Commit IDs and deployment details are recorded in `RELEASE.md`.

First-Proof commit IDs

- `a3a1452` — packet before code.
- `f56d110` — typed pilot economics model.
- `cf3ab38` — responsive dashboard.
- `237ad92` — persona findings and decisions.
- `3e1d581` — numeric step validation fix and regression test.
- `7bc7815` — dependency security update (pushed to `origin/main` after the original feature release).
- `761c101` — release evidence and assignment deliverables.

Full transcript availability

The complete conversation is still missing from this PDF. To export the exact source in VS Code on macOS:

1. Reopen this conversation in the **Chat** view.
2. Press **⇧⌘P** to open the Command Palette.
3. Run **Chat: Export Chat...** and save the JSON. VS Code documents that this export contains all prompts and responses.
4. If the assignment also requires tool-call details in a readable transcript, right-click the conversation background and choose **Copy All**, then paste the Markdown into a file. (The Chat view's Copy All includes prompts, responses, and tool calls.)
5. Open that Markdown in a text editor, print, and choose **Save as PDF**. Replace `BUILDCHAT_JoseFernando.pdf` with that actual exported conversation PDF. Do not submit this session-record extract as the complete transcript.
